COURIER MANAGEMENT SYSTEM

Naan Mudhalvan Project Report

Project Platform: Salesforce

Project Type: Cloud-based Management System

User Name: Nivetha M.

Project Domain: Courier / Customer / Shipment Management

This report documents the Salesforce configuration and management components used for the Courier Management System.

15. Report and Dashboard

16. Conclusion

17. Screenshots / Evidence

1. User Name

The project is prepared for the student user and the Salesforce configuration is maintained under the project account.

- Student: Nivetha M.
- Project: Courier Management System
- Platform: Salesforce

2. Introduction

The Courier Management System is designed to organize courier-related information in a centralized Salesforce environment. It can be used to maintain customer information, shipment details, delivery status and operational records. Salesforce objects, fields, tabs, page layouts, flows and reports help convert manual record management into a structured digital process.

- Centralized customer and shipment records.
- Easy searching and updating of courier information.
- Improved data consistency through validation.
- Reports and dashboards for monitoring operations.

3. Project Overview

The system is planned as a cloud-based application for managing the main activities of a courier service. The Salesforce implementation uses custom objects and configuration features to represent customers and shipments.

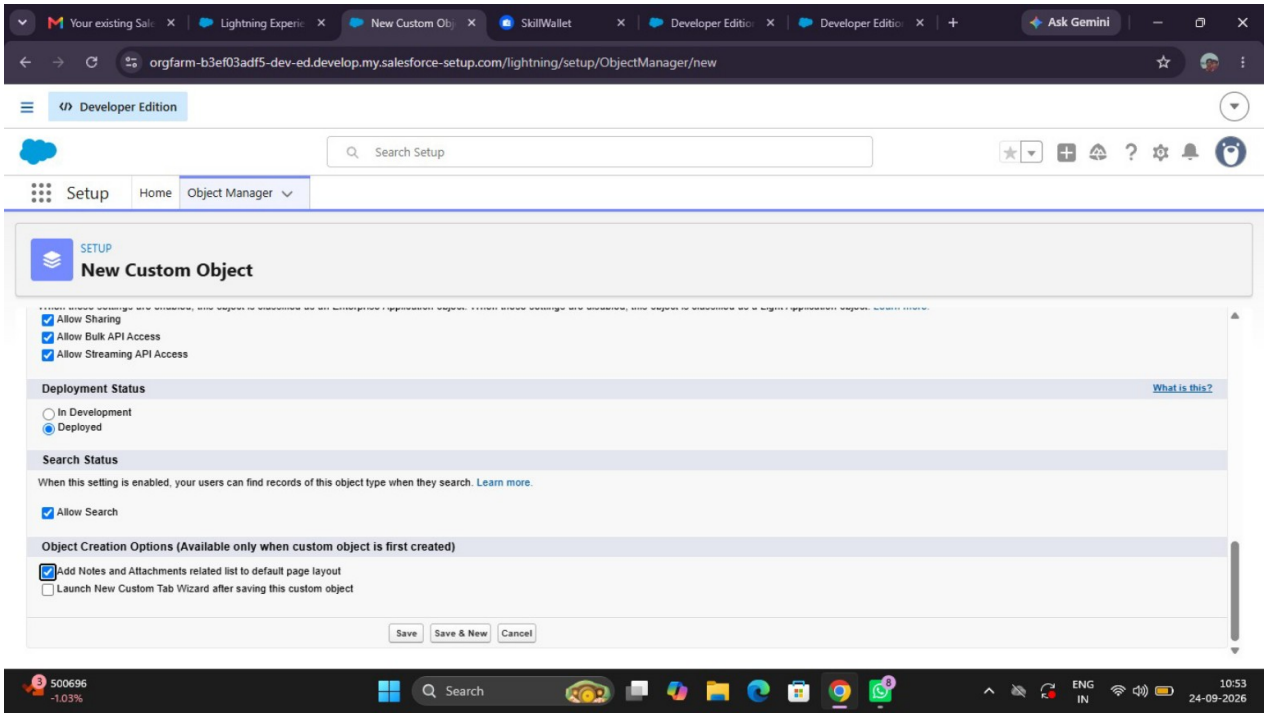

- Customer management
- Shipment and courier tracking
- Data validation
- User access control
- Workflow automation using Flows
- Reports and dashboards

4. Salesforce Account

A Salesforce Developer Edition environment is used to configure the project. The account provides access to Setup, Object Manager, App configuration and other Salesforce administration features.

- Login to the Salesforce Developer environment.
- Open Setup and Object Manager.
- Create and configure the required custom objects.
- Configure users, permissions and application components.

Project Screenshot

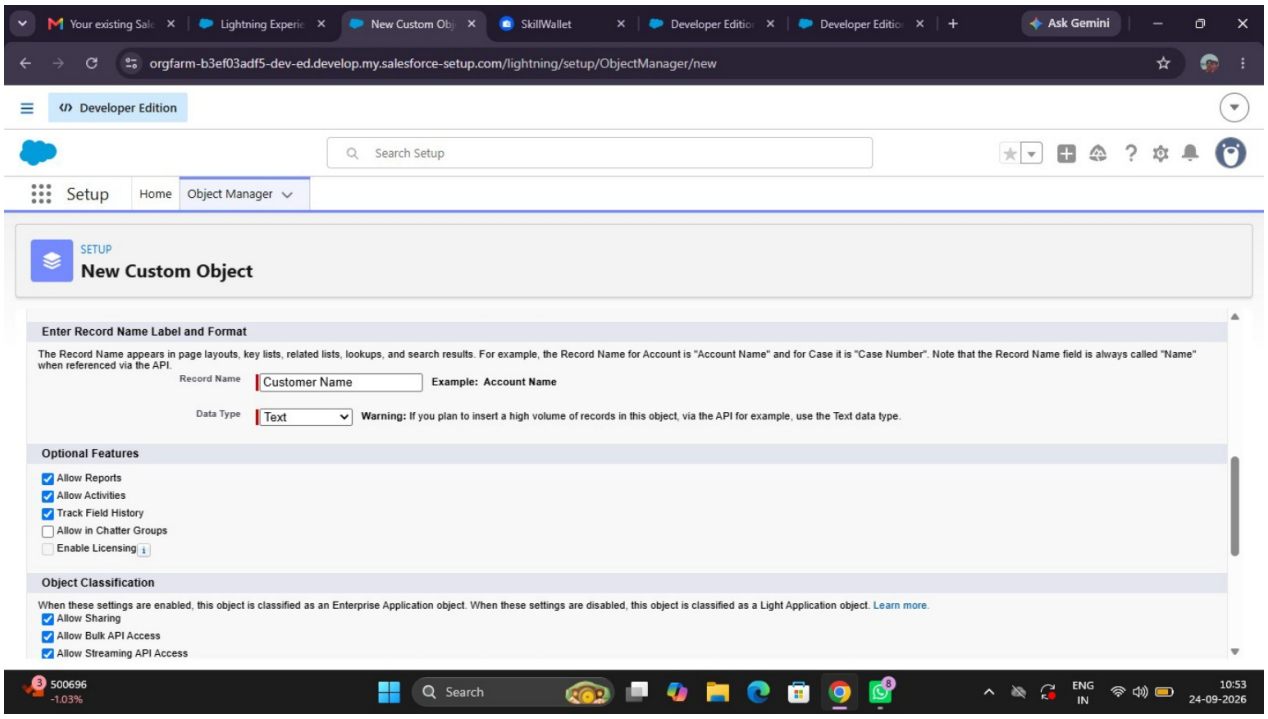

5. Object

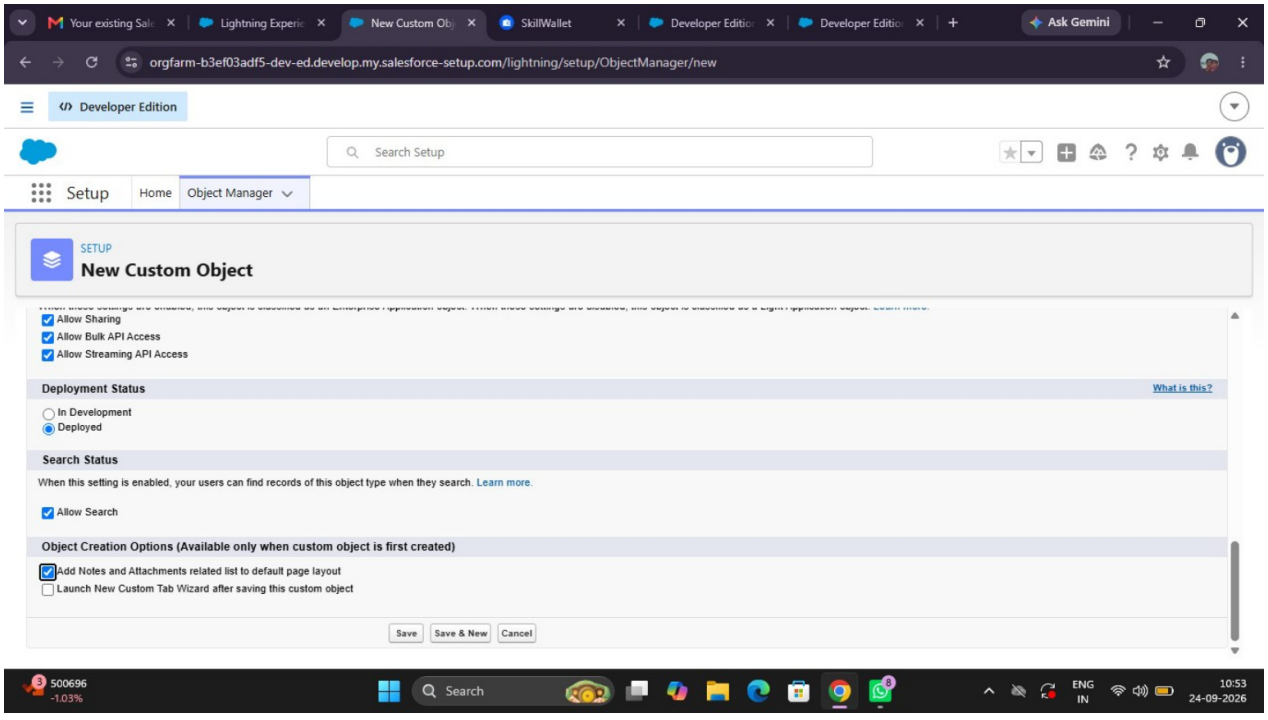

Custom objects are used to store project-specific information. In the supplied configuration screenshots, a Customer custom object is created with the singular label Customer and plural label Customers. The record name is configured as Customer Name.

- Object Label: Customer
- Plural Label: Customers
- Object Name: Customer
- Record Name: Customer Name
- Data Type for Record Name: Text

6. Tabs

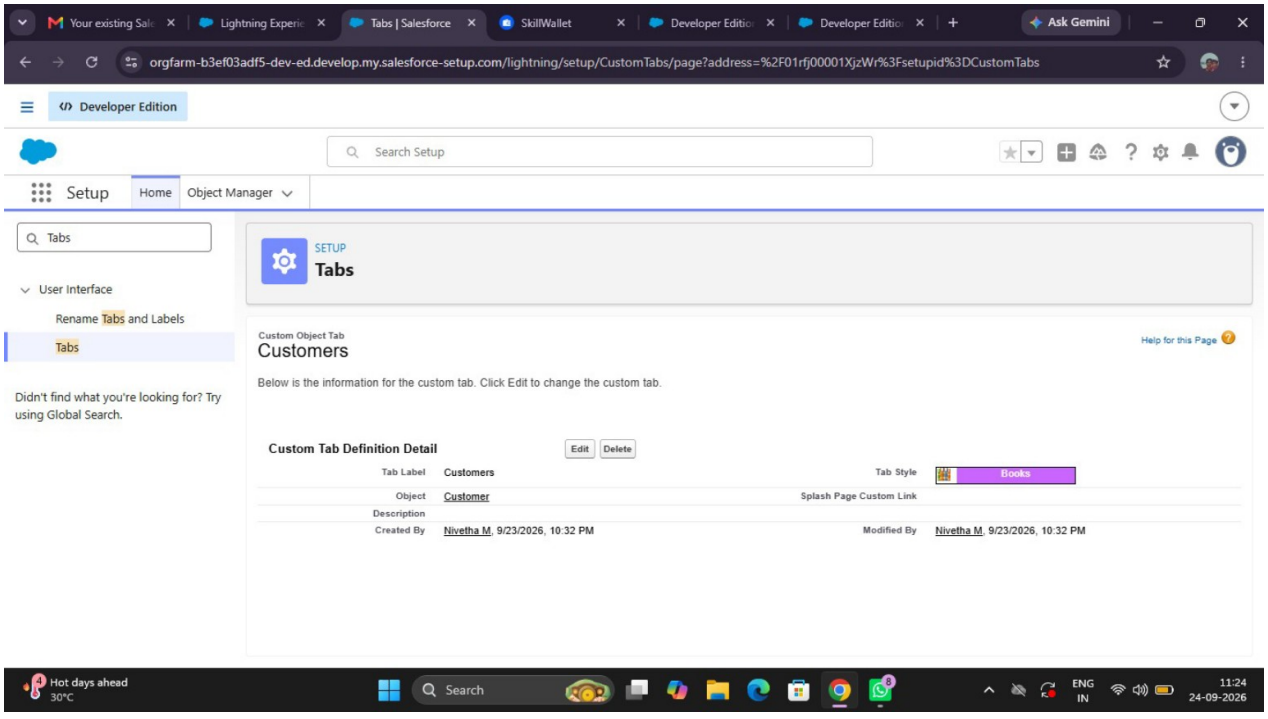

Custom tabs provide a simple navigation entry for Salesforce objects. A Customers tab is configured so users can access customer records from the application interface.

- Create a custom object tab.
- Select the required custom object.
- Choose a tab style.
- Save the tab and make it available to users.

Project Screenshot

7. Fields and Relationships

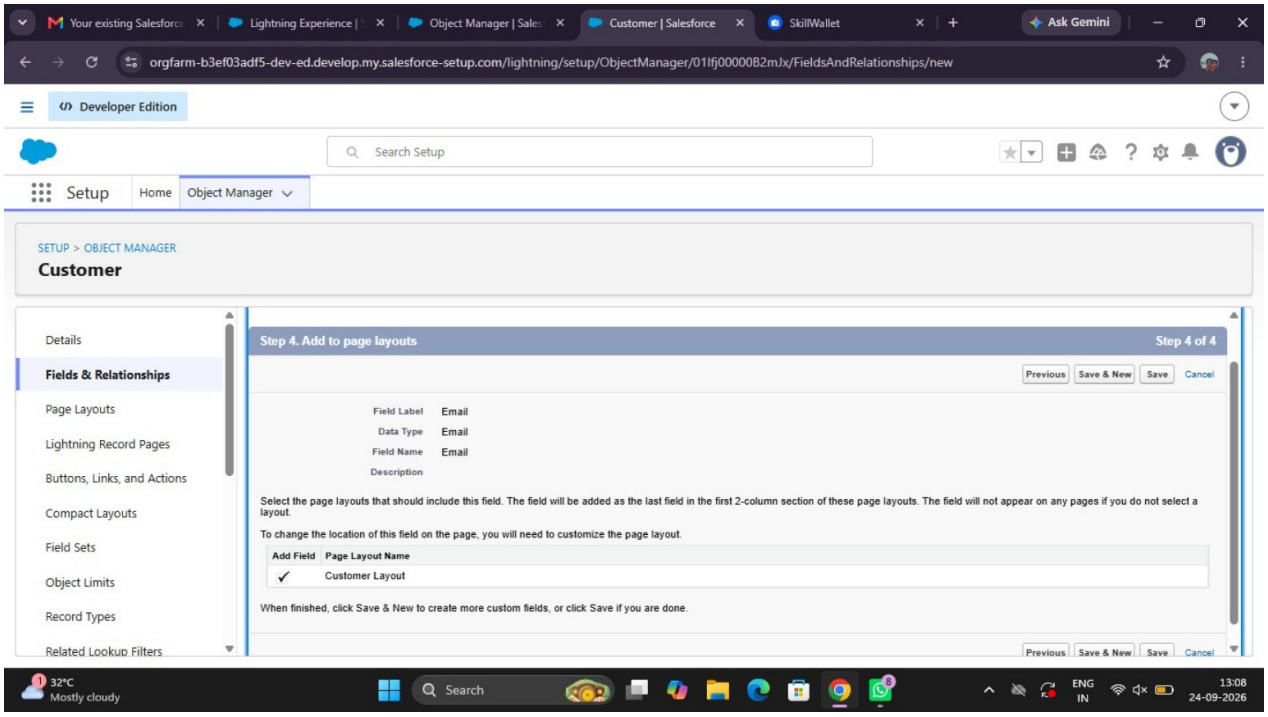

Fields store individual pieces of information for each record. The supplied screenshots show the Customer object Fields & Relationships page and the creation of an Email field. Standard ownership and audit fields are also visible.

- Customer Name – Text
- Email – Email
- Owner – Lookup(User, Group)
- Created By – Lookup(User)
- Last Modified By – Lookup(User)

8. Validation Rules

Validation rules help prevent incorrect or incomplete data from being saved. For the Courier Management System, validation can be applied to fields such as email, phone number, shipment date and delivery status.

- Require important customer details.
- Check valid email format.
- Prevent invalid shipment or delivery dates.
- Allow only valid status values such as Booked, In Transit, Delivered or Cancelled.
- Display a clear error message when a rule is violated.

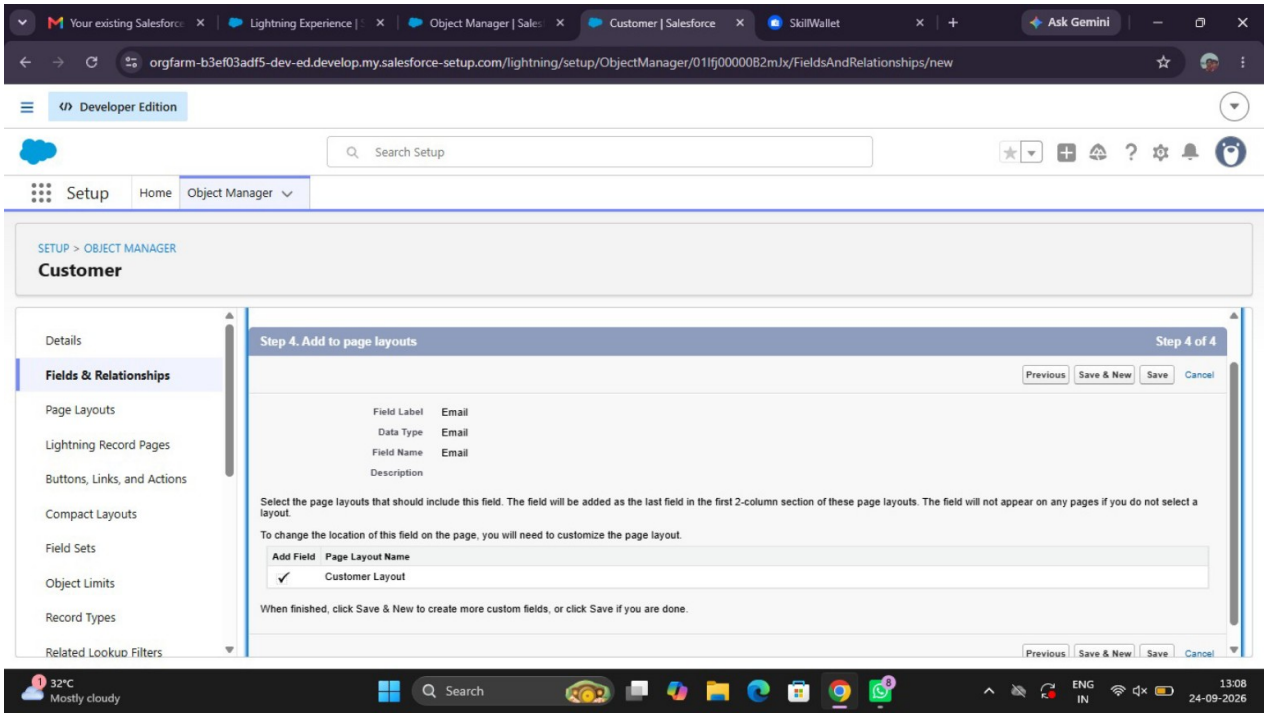

Note: No separate validation-rule screenshot was included in the uploaded evidence, so this section documents the intended project configuration.

9. Page Layout

Page layouts control which fields, sections, buttons and related lists are displayed when users view or edit records. In the supplied screenshot, the Email field is selected to be added to the Customer Layout.

- Customer Layout is used for the Customer object.
- Fields can be added to the layout.
- The layout controls the user-facing record page.
- The layout can be adjusted without changing the underlying data model.

Project Screenshot

10. Flows

Salesforce Flow can automate repetitive courier-management activities. A flow can be designed to update shipment status, notify users, validate process conditions or create related records based on defined triggers.

- Record-triggered flow for shipment updates.
- Automatic status changes based on business conditions.
- Notifications for important courier events.
- Reduced manual data-entry work.

Note: No separate Flow Builder screenshot was included in the uploaded evidence.

11. The Lightning App

The Lightning App provides a unified user interface for accessing the Courier Management System. Relevant tabs such as Customers and Shipments can be included so users can move between records and operational features.

- Add required navigation tabs.
- Provide access to customer and shipment records.
- Use Lightning pages and components where required.
- Keep the interface simple for daily courier operations.

Note: No separate Lightning App Builder screenshot was included in the uploaded evidence.

12. Profile

A Salesforce profile defines baseline permissions for users. For this project, profiles can be configured to control access to Customer and Shipment objects, fields and administrative features.

- Object permissions: Read, Create, Edit and Delete as required.
- Field-level security for sensitive fields.
- Tab visibility for project objects.
- Administrative access should be limited to authorized users.

13. Role

Roles help organize users in the Salesforce role hierarchy and can influence record visibility. A courier organization can use roles such as Administrator, Manager and Courier Staff according to its access requirements.

- Administrator – manages configuration.
- Manager – monitors customer and shipment records.
- Courier Staff – works with assigned courier records.
- Role hierarchy can support controlled record visibility.

14. User

A Salesforce user represents an individual who can log in to the system. User settings connect the person with a profile and, where required, a role.

- Create a user with a unique username and email.
- Assign the appropriate profile.
- Assign a role when role-based access is required.
- Set an active status and suitable permissions.

15. Report and Dashboard

Reports organize Salesforce records into useful views, while dashboards present important information visually. For a Courier Management System, reports can summarize customers, shipments, delivery status and pending deliveries.

- Customer report – list of registered customers.
- Shipment report – courier records and current status.
- Delivery-status report – Delivered, In Transit, Booked and Cancelled.
- Dashboard – summary of courier activity using charts and metrics.

Note: No separate Report Builder or Dashboard screenshot was included in the uploaded evidence.

16. Conclusion

The Courier Management System demonstrates how Salesforce can be configured to manage courier-service information using custom objects, tabs, fields, page layouts, validation, automation, access control and reporting. The supplied screenshots provide evidence of the Salesforce object, field and tab configuration steps used during the project.

17. SCREENSHOTS / PROJECT EVIDENCE

The following screenshots were supplied for inclusion in the project report.
